

# 2022 Coding and Reimbursement Guidelines for the CuffMend™ Rotator Cuff Repair Augmentation System

To help answer common coding and reimbursement questions about arthroscopic procedures completed with the CuffMend technique, the following information is shared for educational and strategic planning purposes only. While Arthrex believes this information to be correct, coding and reimbursement decisions by AMA, CMS, and leading payers are subject to change without notice. As a result, providers are encouraged to speak regularly with their payers.

## Value Analysis Significance:

CuffMend rotator cuff repair augmentation provides a straightforward approach for augmenting partial- and full-thickness rotator cuff tears using a decellularized dermal allograft to provide mechanical strength<sup>1</sup> and added biology to the repair construct. The system includes a graft spreader for introducing the ArthroFlex decellularized dermal allograft and TissueTak™ tendon anchors for medial soft-tissue fixation to the rotator cuff tendon. Lateral bony fixation is accomplished with PushLock® anchors spanning the graft over the footprint. The scientific literature supports the use of a decellularized dermal allograft as an option for augmentation in rotator cuff repair<sup>2,3</sup>. This has led to significant clinical interest, particularly for challenging repairs such as revisions or when retears are a concern due to suboptimal tendon quality.

## Coding Considerations:

Codes provide a uniform language for describing services performed by healthcare providers. The actual selection of codes depends upon the primary surgical procedure, supported by details in the patient's medical record about medical necessity. It is the sole responsibility of the healthcare provider to correctly prepare claims submitted to insurance carriers.
